

The Complete Bloxd.io Field Manual

Bloxd.io is a free browser sandbox with 30+ official game modes and a full player-built game engine underneath it. This manual covers every official mode, the four Worlds map types, and the two real ways to build your own game: exporting a world you built block-by-block, and scripting live logic with the JavaScript Code API. If you only read one section, read the custom-game pipeline near the bottom — that's where you go from "playing Bloxd" to "making Bloxd."

30+ Official modes ~32 permanent	4 Worlds map types Default / Flat / 1-Wide / Sky Grid	64 World Code callbacks tick, onPlayerJoin...	550+ Blocks & items in the Creative menu
---	--	---	---

I. How To Think About Bloxd's Modes

1. Three families

Every mode falls into one of three buckets. Knowing the bucket tells you what to expect before you load in.

- **Sandbox / open-world** — Survival, Peaceful, Creative, One Block, Plots. Persistent worlds you build in. No round timer.
- **Battle / minigame** — Bedwars, Skywars, Cube Warfare, Hide and Seek, Murder Mystery, Infection, Pirates, Lucky Towers, 1v1 Fights. Short rounds, win conditions, matchmaking.
- **Worlds** — not really a mode but the engine. Any sandbox mode can be spun up as your own private/public lobby that you fully control. This is the gateway to making custom games.

2. Modes are voted in

New modes ship in pairs and the community picks the survivor. Two modes launch at once; whichever gets played more stays. Recent matchups: Sky Islands beat Goal Rush, Core Defenders beat Heroes vs Brainrots, The Bloxd SMP beat Simon Says. Losers go to "Legacy Games" rather than being deleted outright.

- You don't vote on the site — raw playtime is the vote.

- This is why the roster shifts constantly; some modes you'll see are weeks old.

II. The Sandbox Modes

1. Survival MOST PLAYED

The flagship: loot, fight, protect land, build a base. Averages ~2.4k concurrent players. Script name `classic_survival`. Open, near-infinite world shared by everyone in the lobby.

- **Homes:** `/sethome` sets up to 3 teleport homes (blocked for 10s after taking damage).
- **Tribes:** 2 iron bars to found one; shared homes, member PvP toggle, tribe protectors (2 moonstone + 1 messy stone).
- **Protectors:** 1 messy stone + 2 diamonds locks a chunk from other players. Max 8 placed at once.
- **Spawn reset:** blocks within 192 of spawn reset every 150 min — ores and loot chests refill, so it doubles as a farm.
- **Combat logging** is punished: leave within 10s of being hit under 80 HP and the game auto-kills you and drops your items.

2. Peaceful

Survival minus the stress. No hostile mobs, no health bar. Explore, gather, build at your own pace. ~500 concurrent. Best entry point if PvP isn't your thing.

3. Creative

Infinite blocks, flight, 550+ items. Script `classic_creative`. Press `Tab` for the full menu. Build anything. ~550 concurrent.

- **Pick Block** (MMB or Alt+LMB) instantly clones any block you aim at into your hand.
- **Protectors are earned** by block count: 1st at 200 blocks placed/broken, scaling to the 8th at 9,000.
- Explosives appear in the menu but are disabled in classic Creative (they work in Creative-mode *Worlds* lobbies).
- **Teleport to fresh land** drops you somewhere no one has touched — useful since the default terrain gets grieved.

4. One Block GRIND

Start on a single floating block and break it forever. It regenerates into new blocks through escalating phases, letting you bootstrap an entire island and economy from nothing. ~700 concurrent. A focused, addictive progression loop.

5. Plots & Greenville

Plots gives you a permanently protected, flat parcel — the right home for big or flat-land builds (airports, cities) since Creative terrain is rugged and unprotected. **Greenville** is a chill social town: build a home, earn coins, play embedded mini-games like Spleef and Isle of Grove. ~450 concurrent.

III. The Battle & Minigame Modes

1. Bedwars

TEAM PVP

Defend your bed, break theirs. Teams fight on floating islands; once your bed is gone you can't respawn. Comes in Solos, Duos, Trios, Squads (4-player, ~900 concurrent and the most popular variant), and 4v4.

2. Skywars

Sky-island deathmatch. Spawn on a small floating island, loot chests, bridge to enemies, knock them into the void. Fast, high-variance, last-player-standing.

3. Hide and Seek

Hiders disguise as blocks; seekers hunt them down. Script `hideseek`. Hiders go invisible and become one of five map-specific blocks (e.g. Bookshelf, Hay Bale) after standing still 5 seconds. Two seekers start with a gold sword and an energy bar (15, drains 1 per swing). Caught hiders convert to seekers. Hiders win if any survive 5 minutes. Four maps: Town, Office, Western, Underwater.

4. Cube Warfare, Infection, Pirates & more

The shooter-and-chaos tier. Quick-summary of the rest of the rotation:

- **Cube Warfare** — gun-based firefights, Free-For-All or Teams. Aim and movement focused.
- **Infection** — one infected player converts survivors until everyone's turned.
- **Pirates** — chaotic ship-vs-ship naval battles.
- **Murder Mystery** — one secret murderer, one armed sheriff, innocents survive or expose the killer.
- **Lucky Towers / Lucky Blocks Battlegrounds** — RNG loot from lucky blocks decides fights.
- **Last Stand, 99 Nights, Core Defenders, Sky Islands** — wave-survival and defense variants.
- **1v1 Fights** — dueling suite: Sword Fight, Build Fight, Bridge Fight, Bed Fight.

- Fishing, Clutch, The Bloxd SMP, Tsunami Steal Brainrots — newer voted-in modes spanning relaxed and competitive play.

IV. Worlds — Your Own Lobby

1. What "Worlds" actually is

Worlds are custom lobbies you own and control — the foundation of every custom game. Pick a base mode in the main menu, scroll down, hit **+ Create**. You become the owner with moderation powers, build tools, and (critically) access to the code system.

- **Visibility:** Public (listed), Unlisted (joinable by link), or Private (you only).
- **Note:** lobby names can't be reused or renamed later — choose carefully.
- Open World is recommended as the base, because most owner commands are disabled in the packaged minigame modes.

2. The four map types

Your world's terrain is set once at creation.

TYPE	WHAT YOU GET
Default	Endless procedurally-generated biomes, like the sandbox modes.
Flat	Grass over 4 dirt, 1 stone, 1 bedrock. Ideal for clean builds and arenas.
One Block Wide	Biomes generate but the world is a single block wide — a challenge map.
Sky Grid	Random blocks spaced 3 apart in all directions, lava floor at the bottom. Survival puzzle.

3. Owner controls worth knowing

The advanced options are what make a lobby feel like a designed game.

- `/setspawn`, Set Warp, world border (radius or off), void death height (must be < -100).
- Toggle fall damage, mobs, protectors, tribe creation, teleport requests, keep-inventory.
- `/gm [player] [mode]` sets a single player's mode; modes include Survival, Creative, Peaceful, Spectator, and the Adventure variants (can't place/break blocks).

- `/togglelock`, `/kick`, `/ban`, `/kickall` for moderation — be careful who you let edit; absent owners get grieved.

V. Building Your Own Custom Game

1. The big picture

START HERE

A custom game is just a Worlds lobby you build, configure, then publish. Custom Games launched May 2025; thousands now exist, sorted into Minigames, PvP, Simulator, Parkour/Obby, Racing, and PvE categories (all tagged "Player Crafted"). The top 8 by active players in each category surface on the main menu. The pipeline has three stages: build the map → add logic with code → export & publish.

2. Stage one — build with WorldBuilder

WorldBuilder edits huge volumes of blocks at once via slash-commands, so you're not placing blocks one by one.

COMMAND	DOES
<code>//wand</code>	Gives the selection wand.
<code>//pos1</code> / <code>//pos2</code>	Set the two corners of a region.
<code>//set [block]</code>	Fill the region with a block (e.g. <code>//set Stone</code>).
<code>//replace [a] [b]</code>	Swap one block type for another in the region.
<code>//copy</code> / <code>//paste</code>	Duplicate structures.
<code>//clear</code>	Wipe all blocks in the region.
<code>//schematic save [name]</code>	Save a structure to reuse in other worlds.
<code>//schematic load</code>	Load a saved schematic.

3. Stage three — export & publish

Two routes to publish, both owner-only:

- **Menu route:** open the Shop menu → *World Builder* tab → **Export Custom Game** (also "Export as Custom Game" in the owner shop menu). It only exports the chunks you actually edited.
- **Command route:** `//worldexport` (a.k.a. `//exportworld`) uploads the whole world as a custom game.
- Edit settings afterward via the **Edit** button on your published schematic page or `//schematic list`: spawn protection, fall damage, world borders, and (since April 2026) a custom thumbnail.

VI. Stage Two — Coding Real Game Logic

1. Code Blocks vs World Code

CORE CONCEPT

Bloxd runs real JavaScript through an `api` object — this is what turns a map into a game. There are two places code lives, and the difference matters:

- **Code Block** — runs when a player *clicks* it (or a "Press to Code" board). Each runs in isolation and resets every use (no saved variables). Great for jump pads, teleporters, shops, item-givers.

- **World Code** — runs globally in response to game events. Press F8 to open it. This is where round logic, scoring, and persistent rules live.
- Only the owner, co-owners, and users with `canEditCode = true` can edit code.

2. The environment & its rules

It's JavaScript, but a restricted flavor (QuickJS). Code these constraints into your muscle memory or things silently break:

- No `window`, no `setTimeout`, no `async` — everything runs synchronously.
- Avoid `let/const/var` in global scope; wrap logic in a function or it may not run.
- Built-in globals: `myId/playerId` (who triggered it) and `thisPos` (the block's `[x,y,z]`).
- Debug with `api.log(...)` or `console.log(...)`. Use `"lime"` not `"green"` for readable chat text.
- Official docs live at bloxd.io/docs and the full API on the Bloxdy `code-api` GitHub README.

3. The API, by category

The `api` object is huge. Here's the map of what's available.

CATEGORY	SAMPLE CALLS
Player actions	<code>setVelocity</code> , <code>applyImpulse</code> , <code>forceRespawn</code> , <code>setPlayerPose</code> , <code>kickPlayer</code>
Messaging	<code>sendMessage</code> , <code>broadcastMessage</code> , <code>sendFlyingMiddleMessage</code>
Entities & blocks	<code>getPosition</code> , <code>setPosition</code> , <code>setBlock</code> , <code>setBlockRect</code> , <code>getPlayerIds</code>
Health & damage	<code>getHealth</code> , <code>setHealth</code> , <code>applyHealthChange</code> , <code>killLifeform</code> , <code>killstreaks</code>
Inventory & items	<code>giveItem</code> , <code>removeItemName</code> , <code>getHeldItem</code> , <code>clearInventory</code>
Mobs	<code>attemptSpawnMob</code> (with variations & colors)
UI & visuals	<code>playParticleEffect</code> , <code>sendTopRightHelper</code> , <code>progressBarUpdate</code> , QTEs
Cosmetic	<code>changePlayerIntoSkin</code> , <code>updateEntityNodeMeshAttachment</code> (capes, karts, golems)

4. World Code callbacks

There are 64 event hooks. You define a function with the callback's name and it fires automatically. The ones you'll use constantly:

- `tick` — every frame; the heartbeat for timers and scoring.
- `onPlayerJoin(id)` / `onPlayerLeave` — setup and teardown per player.
- `onBlockStand(id,x,y,z,blockName)` — trigger pads/traps from terrain.
- `onPlayerKilledOtherPlayer`, `onPlayerDamagingOtherPlayer` — combat & rewards.
- `onPlayerChat`, `playerCommand`, `onPlayerBoughtShopItem`, `onChunkLoaded` — interaction & economy.

5. Copy-paste starters

TRY THESE

Real snippets straight from the API, ready to drop in.

Jump pad (Code Block):

```
api.setVelocity(myId, 0, 12, 0)
```

Welcome message on join (World Code):

```
function onPlayerJoin(id) {  
  api.sendTopRightHelper(id, "star",  
    "WELCOME TO MY WORLD",  
    {color:"yellow", duration:9})  
}
```

Super-trampoline block (World Code):

```
onBlockStand = (id,x,y,z,blockName) => {  
  if (blockName === "Red Chalk") {  
    api.setVelocity(id, 0, 20, 0)  
  }  
}
```

Drop coins on a kill (World Code):

```
onPlayerKilledOtherPlayer = (a,b,c,d) =>  
  api.giveItem(a, "Gold Coin", 1)
```

Give an enchanted item:

```
api.giveItem(myId, "Diamond", 1, {  
  customDisplayName: "Enchanted Diamond",  
  customAttributes: {  
    enchantments: { "Critical Damage": 100 },  
    enchantmentTier: "Tier 5"  
  }  
})
```

“

Build the map with WorldBuilder. Wire the rules with World Code.
Export, publish, iterate. That loop is the whole game-maker.

The custom-game pipeline in one line

VII. A First Project, Step By Step

Make a tiny parkour-and-reward game

A concrete path from zero to a published game in an afternoon.

- 1. Main menu → pick Creative (or Survival) → scroll → + **Create**. Name it, set visibility to Private while you build, pick Flat map type.
- 2. `/setspawn` at your start line. Turn on a world border and a void death height so falls reset the player.
- 3. Build the course. Use `//wand`, `//pos1/2`, `//set` to lay platforms fast; `//copy/paste` to repeat sections.
- 4. Place a Red Chalk block as a launch pad and add the trampoline snippet to World Code (F8).
- 5. Put a Code Block at the finish that gives a reward: `api.giveItem(myId, "Diamond", 5)` and a congrats message.
- 6. Test solo. Then Shop menu → World Builder tab → **Export Custom Game** (or `//worldexport`).
- 7. Upload a thumbnail, set the category, flip visibility to Public, and share the link.

Hard-won gotchas

- Export only saves **edited chunks** — if part of your map looks untouched-but-natural, place a block in it so it persists.
- Code Blocks **forget everything** between clicks. For anything that needs memory (scores, timers), use World Code with global variables.
- No `async` / `setTimeout` — schedule delays by counting `ticks`.
- Protect your code: anyone who can edit can copy it. Use the owner-only "Hide Lobby Code" toggle at the bottom of the Lobby Moderation tab.
